ABSTRACT

Objective: To investigate the anti-hyperlipidemic, anti-inflammatory and analgesic properties of E. longifolia root extract in animal models.

Methods: In this study, glucose-fructose enriched diet-induced hyperlipidemia, carrageenan-induced paw edema and acetic acid-induced writhing were used to evaluate the anti-hyperglycemia, anti-inflammatory and analgesic activities, respectively. At the end of the experiment of glucose-fructose enriched diet-induced hyperlipidemia, blood samples were collected and estimation of blood lipids were carried out. Edema thickness was measured using digital caliper at 0, 15, 30, 45, 60, 90, 120, 180, 210, 240, 270, 300, 330, and 360 min after carrageenan injection. The number of abdominal writhing for each mouse was observed and counted during a period of 1 h post injection of acetic acid.

Results: E. longifolia root extract demonstrated a significant reduction of triglyceride levels ($p<0.05$) compared with the control group in glucose-fructose enriched diet in rats. In anti-inflammatory test, the extract significantly inhibited the carrageenan induced paw edema formation ($p<0.05$). The extract also significantly decreased the number of writhing in acetic acid-induced mice ($p<0.05$).

Conclusion: E. longifolia root extract showed a significant anti-hyperglycemia, anti-inflammatory and analgesic activities. Further studies are needed to determine mechanisms for its activities of E. longifolia root extract.

Keywords: Eurycoma longifolia, Antihyperglycemia, Anti-inflammatory, Analgesic

INTRODUCTION

Obesity and the metabolic syndrome continue to plague the world at an alarming rate. Those will cause both substantial socio-economic and physical burden in society. WHO reported that in 2014, over 1.9 billion adults were estimated to be overweight and more than 600 million obese [1].

Recently people have been using natural products and plant to treat a wide variety of clinical disease. One of the most popular traditional plants Eurycoma longifolia Jack (Simaroubaceae) is a well-known folklore herbal medication in Southeast Asia. Wide spectrum of pharmacological activities of E. longifolia has been reported [2-5]. Despite wide range of traditional uses known, it is most solely for its aphrodisiac and anti-malarial properties [6].

Preparation of E. longifolia root extract

The root of E. longifolia was powdered and extracted with 95% (v/v) methanol for 48 h at room temperature. The methanol extract was then distilled, evaporated to obtain semisolid E. longifolia root extract (EL) (yield 9.32%) and re-dissolved in CMC-Na (1% w/v).

Test animals and housing

28 adult male Wistar rats (150-250 g), and 25 adult male and 25 female Swiss mice (20-30 g) were obtained from the Immo Laboratory, Sanata Dharma University, Indonesia. The animals were maintained under standard laboratory condition. They were housed in standard cages (five animals per cage) at temperature 22±2 °C and 12:12 light dark cycle. The animals were provided with pelleted diet as normal diet or glucose-fructose enriched diet (GFED) and water ad libitum. All procedures described were reviewed and approved with approval number KE/KF/337/EC by Medical and Health Research Ethics Committee Faculty of Medicine Gadjah Mada University Yogyakarta Indonesia.

E. longifolia was supplied by Merapi Farma Herbal Co. (Batch No. SLA102015. PB; Yogyakarta, Indonesia) and were collected from Kalimantan Island Indonesia. The voucher specimen was deposited at the Laboratory of Pharmaceutical Biology, Faculty of Pharmacy Sanata Dharma University in Yogyakarta Indonesia. The following chemicals were used: sodium carboxy methyl cellulose/CMC-Na (Brataco Chemika, Indonesia); glucose, fructose, methanol and acetic acid (E. Merck, Darmstadt, Germany). Instruments used in this study included Cobas C501 (Roche Diagnostics) for serum chemistry analysis.
Anti-inflammatory study

Male Swiss mice were divided into five groups randomly (negative control, positive control and dose groups), consisting of 5 mice in each group. Acute edema was induced by the injection of carrageenan 1% (prepared in normal saline) into the sub-plantar region of hind-paw of mice [11]. Then, each group was treated orally with 1% CMC-Na (negative control), 4.48 mg/kg BW of diclofenac sodium (positive control), and treatment doses of 105, 210 and 420 mg/kg BW EL [10]. Edema thickness was measured using digital caliper at 0, 15, 30, 45, 60, 90, 120, 150, 180, 210, 240, 270, 300, 330, and 360 min after carrageenan injection [12, 13]. The calculation of the edema volume was conducted using formula area under curve (AUC) and percentage of inhibition of inflammation [13-15].

Area under curve (AUC) was calculated for each minute within 0-6 h using trapezoid method formula, as below:

\[
\text{AUC}_{t_n} = \frac{T_{n+1} + T_n}{2} (t_n - t_{n-1})
\]

\[T_{n+1}: \text{Average edema volume on } t_{n+1}\]

\[T_n: \text{Average edema volume on } t_n\]

Analgesic study

The analgesic activity of EL was tested using acetic acid-induced writhing method [11, 14, 15, 17]. Female mice Swiss were divided randomly into five groups (n=5). Group I as negative control received 1% CMC-Na, group II as positive control received 91 mg/kg BW of aspirin, group III-V received 105, 210 and 420 mg/kg BW of EL respectively. After 5 min of treatment, all animals were administered 1% with 50 mg/kg BW of acetic acid intraperitoneally. The total number of writhes was recorded at intervals of 5 min for a period of 1 h. The calculation of percentage of inhibition using the following ratio: (control mean–treated mean)/control mean x 100 [14, 15].

Statistical analysis

Results are expressed as mean±standard deviation (SD). Data were analyzed using one-way analysis of variance followed by post-hoc Tukey HSD tests using SPSS 22. A p-value<0.05 was considered statistically significant. Statistical differences were determined using the Student’s t-test, with p-values being indicated for each fig.

RESULTS

Effect of E. longifolia root extract in hyperlipidemia-induced rats

The administration of GFED significantly increased (p<0.05) TG levels up to 186.1% and decreased high-density lipoprotein (HDL) levels by 43.0% (table 1). GFED did not increase serum total cholesterol or low-density lipoprotein (LDL) levels.

Daily administration of both doses of EL for 5 d led to a significant reduction (p<0.05) in TG compared with the GFED group. There was no significant difference in HDL levels among all doses of EL and those of the GFED group.

Effect of E. longifolia root extract on carrageenan-induced mice

The anti-inflammatory activity of E. longifolia root extract against carrageenan induced paw edema showed that the extracts exhibit significantly (p<0.05) and dose-dependently reduced the paw edema swelling (table 2). The percentage inhibition in the paw edema in mice treated with E. longifolia root extract was found to be 15.7; 22.0 and 26.8% at the dose of 105; 210 and 420 mg/kg BW respectively.

Effect of E. longifolia root extract on acetic acid-induced writhing in mice

Table 3 showed the effect of E. longifolia root extract on acetic acid-induced writhing in mice. All of the doses of E. longifolia root extract produced significant (p<0.05) reduction of writhing by the acetic acid in a dose dependent manner.

CONFLICTS OF INTERESTS

Additionally, the *E. longifolia* root extract showed significant analgesic action at all doses level (10, 20 and 40 mg/kg BW). Analgesic effect was evaluated using acetic acid-induced writhing test in mice. Acetic acid injection has been associated with increased levels of E and F prostaglandins in peritoneal fluids as well as lipoxygenase products [23]. The significant reduction of *E. longifolia* root extract might be due to the presence of analogical principles acting with the prostaglandin pathways.

It has been reported that *E. longifolia* contains quassinoids, triterpene, biphengyneloidan and alkaloid [7, 24-26]. The presence of eurycomanone, 14,15-dihydroeurycomanone and 13, 21-dehydroeurycomanone in *E. longifolia* root were identified as potent NF-kB inhibitors [27, 28]. They act by inactivation of the NF-kB signaling pathway, a pro-inflammatory transcriptional factor. Therefore, their inhibition results in anti-inflammatory effect. Anti-inflammatory and analgesic effects of *E. longifolia* root extract in this study are in agreement with a previous study. Han et al. demonstrated that methanolic extract of *E. longifolia* root has a potential analgesic agent on both heat-induced pain and chemical induced pain in hot plate test and acetic acid-induced writhing test, respectively. Methanolic extract of *E. longifolia* root also has anti-inflammatory agent on carrageenan-induced paw edema [29].

CONCLUSION

In conclusion, we can confirm that *E. longifolia* root extract are endowed with anti-hyperlipidemic activity in rats. These reductions of TG may be associated with a previous in vitro report in which *E. longifolia* suppressed lipid accumulation in 3T3-L1 adipocytes [8].

Carrageenan, as irritant substances, induced inflammation in biphasic event. The initial phase is associated to the release of seletinin, histamine, and bradykinin; while the late phase is attributed to the release of prostaglandin and induc to cyclooxygenase that increasing vascular permeability and the neutrophil infiltration into the inflammatory site and production of free radicals that cause edema [22]. In our results, the *E. longifolia* root extract significantly inhibited paw edema-induced carrageenan in all the dose level.

DISCUSSION

Several studies have reported that a high carbohydrate diet is responsible for the development of hyperlipidemia in rodent models [9, 18-20]. Hyperlipidemia occurs because high fructose in the blood leads to increased de novo hepatic fatty acid synthesis and, subsequently, this releases a high amount of TG [21]. The *E. longifolia* root extract used in our study reduced TG levels induced by glucose-fructose enrich diet. Therefore, the *E. longifolia* root extract has a potent anti-hyperlipidemic activity in rats. These reductions of TG may be associated with a previous in vitro report in which *E. longifolia* suppressed lipid accumulation in 3T3-L1 adipocytes [8].
